
SVTechie BlogSideBar Date Time Offset

Posted by Kopicat - 2007/03/15 18:50

As you can see, I installed the svtechie blogsidebar which is the column on the right. It works really well, except that today's date that is highlighted in the calendar does not corresponds to my current date in my locale.

After some research, I realised that the current date being used is called with

```
$time = time();
```

This will only return the current date time in the system that the web server has been configured on.

In order to let the calendar reflect the date / time correctly in your country with the offset that you had configured in the Joomla global settings, replace the above with:

```
global $mosConfig_offset;
```

```
$time = time() + $mosConfig_offset * 60 * 60
```

Remember to check that you have the inclusion of the global.php at the start of the file.

Personally, I replaced 2 such entries in mod_sidebar.php and 1 entry in blogsidebar.php (component). I believe this might apply to the blogcal too.
